International Accounting Standards Board

This document is provided as a convenience to observers at IASB meetings, to assist them in following the Board's discussion. It does not represent an official position of the IASB. Board positions are set out in Standards. These notes are based on the staff papers prepared for the IASB. Paragraph numbers correspond to paragraph numbers used in the IASB papers. However, because these notes

are less detailed, some paragraph numbers are not used.

# AGENDA PAPER 5E Cover note to example

## **Purpose of this paper**

 This cover note accompanies a simple example that illustrates the application of the elaborated principles set out by the CFO Forum, focusing on the treatment of changes in estimates. The example is very simple, and thus does not illustrate all the features of the models.

## Fact Pattern

- 2. The example illustrates the application of the CFO Forum's elaborated principles to a portfolio of 5 year contracts with the following features:
  - (a) Premium CU 1,000
  - (b) Expected claims CU 160 of claims per year (CU 800 in total).
  - (c) Pricing margin CU 200 at inception.

- (d) Exit value risk margin CU 180 at inception. It is assumed that other market participants require no service margin for this contract.
- (e) Both margins run off evenly over the life of the contracts. For simplicity, discounting, acquisition costs and expenses are ignored.
- 3. In the base case, the expected value of the cash flows and the margin decrease evenly over time, as expected. As the margin is released, CU 40 of profit is recognised each year.
- 4. The example also illustrates the profit that would be recognised each year under the Board's tentative conclusions.
- 5. Cases 2 and 3 illustrate what happens when there is an adverse change in non-financial assumptions<sup>1</sup> at the end of x2.
- 6. In Case 2, the new estimate of expected cash flows at the end of X2 is CU 490 (previous estimate for that date: CU 480). The adverse change reduces the remaining portion of the original margin from CU 120 to CU 110. However, as this still exceeds the risk margin of CU 108, the entire loss is absorbed in the profit margin and will be reflected in lower income over the rest of the contract term. In contrast, under the Board's tentative conclusions, the effect of the change in estimates is recognised immediately.\*
- 7. If the adverse change had been in the financial, rather than non-financial assumptions, then the effect would have been recognised immediately in X2, rather than absorbed in the margin. Thus, for a financial assumption, profit and loss in X2 would have decreased by CU 10 in X2, whereas for a non-financial assumption that decrease is spread equally over X2, X3 and X4.
- 8. In Case 3, the new estimate of expected cash flows at the end of X2 is CU 570, an increase of CU 90. The first CU 12 of this loss is absorbed by the remaining profit margin, which is then exhausted. The remaining CU 78 of the loss is recognised immediately through the liability adequacy test. In contrast, under the Board's tentative conclusions, the entire loss of CU 90 is recognised immediately.<sup>\*</sup>

 $<sup>^{\</sup>rm 1}$  Under the CFO Forum's proposals, the effect of an adverse change in a financial assumption is recognised immediately.

<sup>\*</sup> The example assumes that the insurer estimates that the same risk margin is still appropriate.

## Agenda paper 5F Examples

## Base case

For simplicity, discounting, acquisition costs and expenses are ignored Five year contract

Premium 1,000 at inception

Claims 160 per year, risk even

| Original estimates           | x0    | x1  | x2  | x3  | x4  | x5 |
|------------------------------|-------|-----|-----|-----|-----|----|
| Expected value of cash flows | 800   | 640 | 480 | 320 | 160 | 0  |
| Margin                       | 200   | 160 | 120 | 80  | 40  | 0  |
| Liability recognised         | 1,000 | 800 | 600 | 400 | 200 | 0  |

Assuming the exit value margin starts at 180 and runs off evenly, the liability adequacy test is as follows:

|                              | x0  | x1  | x2  | x3  | x4  | x5 |
|------------------------------|-----|-----|-----|-----|-----|----|
| Expected value of cash flows | 800 | 640 | 480 | 320 | 160 | 0  |
| Margin                       | 180 | 144 | 108 | 72  | 36  | 0  |
|                              | 980 | 784 | 588 | 392 | 196 | 0  |

Result of the liability adequacy test - no additional liability to be recognised

Result of the liability adequacy test - no additional liability to be recognised

Comment:

The adverse change (10) reduces the remaining portion of the original margin from 120 to 110. This still exceeds the exit value margin (180 at inception, 108 in X2), so the entire loss is absorbed in the margin and will be reflected in lower income over the rest of the contract term.

#### The remaining margin at the end of each year can be analysed as follows:

| The formaling margin at the one of outing | our our bo une |      | 5110110. |      |      |      |       |

#### Comment:

Liability

The adverse change (90) reduces the remaining portion of the original margin from 120 to 30. As a result, the liability adequacy test is triggered. In effect, the first 12 of the loss is absorbed by the profit margin, and the remaining 78 is recognised as an expense
